High Power
Champion
David Tubb

The most advanced long-range competition front sight on the market.

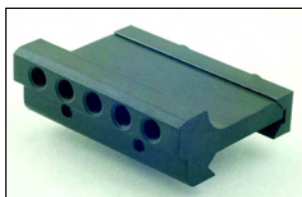

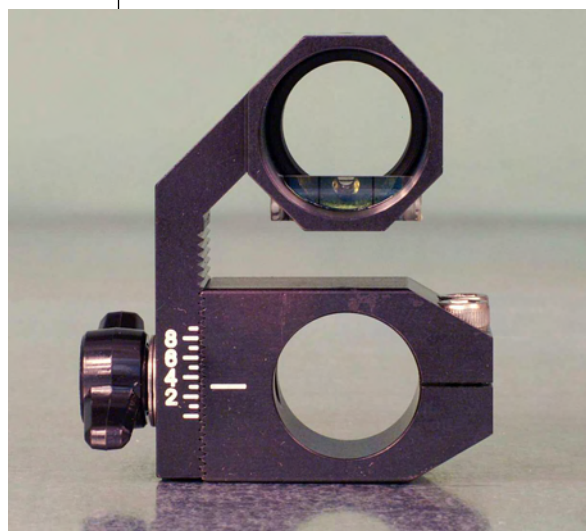

Designed by David Tubb, this new model is specifically engineered to provide a superior NRA High Power Rifle Long Range sighting platform. It provides the correct elevation for 800, 900, and 1000 yard events using a minimum of rear sight click adjustment.

By making elevation compensations and changes at the front sight, the Long Range shooter is able to maintain a much better rear sight mounting position, and, therefore, a better head position.

The height above the bore on this sight is engineered to correlate with common rear sight mounting orientations on conventional bolt-actions such as Winchester Model 70 and custom-action, conventionally-stocked Long Range specialty rifles.

The SSS Inc. Long Range Front Sight features robust construction. Index marks on both sides allow right or left installation.

Each notch provides .050 inches of movement. It has a built in spirit level and accepts 22mm threaded sight inserts (one Delrin thread-protecting insert is included). The level is positioned inside the globe to allow for adequate elevation compensation, plus, this allows the shooter to easily view the level through the rear sight. The Long Range Front Sight mounting area is sized 0.750 inches diameter. This provides the flexibility to fit most barrels having a parallel section at the muzzle, or can be opened up by a gunsmith or machinist to accommodate virtually any size mounting area. It also attaches directly to a SightLine Extension Tube.

Check out the T2K Front Sight and T2K Rear Sight Base. The T2K Front Sight is designed for use by the across the course competitor. There's also a specially engineered front sight for AR15 Match Rifles. The precision-ground base attaches directly to a Picatinny rail mount.
